Abstract - Following the local and regional inventory of the quality of the environmental components with respect to the risks that its are exposed by the energy activities of the Rovinari mining basin, we realized an evaluation of the impact of the sector's activity on the environment. This evaluation is essential for the ecological remediation and rehabilitation process to ensure the safety of the population in the area, being an important tool in the decision process, with the aim of indentifying and selecting activities that must comply with all environmental requirements imposed by competent authorities.

Keywords - Mining Activity, Impact, Risk, Evaluation, Method, Processes.
